

THREE-CHANNEL FLUORESCENCE AND BACKSCATTER SENSOR

LOW POWER,
HIGH SENSITIVITY

The RBRtridente is an optical sensor with three channels, capable of making multiple fluorescence and backscatter measurements simultaneously. Its high dynamic range permits exposure to full sunlight with very low detection limits, while power consumption and depth rating have been tailored for use in a wide variety of applications.

FEATURES

The RBRtridente can integrate any three of the following channels:

- ▶ chlorophyll a
- ▶ fDOM
- ▶ phycocyanin
- ▶ phycoerythrin
- ▶ backscatter
- ▶ turbidity

The size makes the RBRtridente compatible with existing vehicle payload bays. Tolerant of a wide-ranging power supply, data are streamed via RS-232 on the MCBH-6-MP connector. Synchronous detection and automatic gain control allow for full sunlight exposure while still permitting high-resolution measurements of very small signals.

A dry-bay OEM variant of the RBRtridente is available for vehicle integration applications.
